

EXERCISE – Run Phase

Your target is the **WannaCry ransomware Bitcoin wallets** — fully documented, publicly attributed to North Korean Lazarus Group, perfect for practicing transaction graph analysis.

Three known WannaCry payment addresses are publicly documented:

```
12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw
115p7UMMngo1pMvkpHijcRdfJNXj6LrLn
13AM4VW2dhxYgXeQepoHkHSQuy6NgaEb94
```

Using only free public tools — Blockchair, OXT, or WalletExplorer — investigate all three wallets and document:

- Total funds received across all three
- When did activity start and stop
- Did funds move anywhere after collection
- Can you identify any exchange attribution
- What does the transaction pattern tell you about the operator

Write your full analyst note with confidence ratings.

When did activity start and stop?

Confidence: High

i'll consider the "start" of the operation the earliest time one of the three wallets recieved its BTC, in this case 12 May 2017 11AM UTC

while the "Stop" will be the time of the last sent amount of BTC by the MAIN three not a puppet wallet, because the main ones are directly connected to the malware.
in this case:

 ID: 35e5-d8a7  8/03/2017, 05:41:34	From 12t9-6SMw  To 16df-Z8Vy 	-9.03851401 BTC • -\$736,910 Fee 1.1M Sats • \$860.21

The suspicious thing is the amount owned by the wallet since its not common to own 588+ bitcoins, but also, the number of transactions it has (6m+)

- The last 4 pages are minutes ago, not days and all has great amounts of bitcoin in it

history of transactions

So what's the total across the three wallets?

Total cash inflows from all three sources is: 219,837.82 USD

Did funds move anywhere after collection?

Confidence: high

First Wallet Transactions Overview

The first wallet has received a total of 19.69355613 BTC and has sent a total of 17.77113037 BTC, knowing this we can assume the BTC not sent were received after the operation got disrupted.

This address has transacted 250 times on the Bitcoin blockchain. It has received a total of 19.69355613 BTC \$1,602,627 and has sent a total of 17.77113037 BTC \$1,446,183. The current value of this address is 1.92242576 BTC \$156,443.

Where did it send its BTC?

This is the last time this wallet has sent an amount of BTC

Both on the same day, in distance of minutes between each other, but one has 2 outputs, ill start from there:

From	To
1 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.17124673 BTC • \$13,961.76 2 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.18010230 BTC • \$14,683.76 3 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.16656716 BTC • \$13,580.24 4 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.17030000 BTC • \$13,884.58 5 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.16900000 BTC • \$13,778.59 6 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.18040000 BTC • \$14,708.03 7 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.17887884 BTC • \$14,584.01 8 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.33600000 BTC • \$27,394.11 9 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.32000000 BTC • \$26,089.63 10 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw 0.14860000 BTC • \$12,115.37 Load 26 More	1 1JC41YHmjKEcW1rLH6pmMWEFHkoNwSmhnC 0.01227173 BTC • \$1,000.52 2 1FQQ86tMuvhQ4Ruyqgbb8J7IaNfUZ69gpY 8.71529348 BTC • \$710,558

This address has transacted 124 times on the Bitcoin blockchain. It has received a total of 14.87769994 BTC \$1,211,439 and has sent a total of 14.41067602 BTC \$1,173,411 The current value of this address is 0.46702392 BTC \$38,028.15.

From this i've started to see an actual pattern in their cycle of transactions:

- 1st: As the ransomware works, they receive BTC to the three wallets
- 2st: Each wallets before the operation was disrupted has sent all the current BTC into 2 transaction, one has 2 outputs each time while the other just one
- 3st: The single one starts a puppet wallet loop to distract the researcher, and making him waste time following this loop as time goes by

Can you identify any exchange attribution?

Confidence: medium-high

(This answer is based off the intel we have and some basic research, since i did not finish following the loop and since i didnt see it myself instead of high its medium-high rating).

The WannaCry ransomware attack utilized **three hardcoded Bitcoin addresses** to receive ransom payments, as the malware lacked the capability to generate unique wallet identifiers for individual victims. This design flaw made it difficult for attackers to match specific payments to decryption keys, leading experts to speculate that the perpetrators may not have intended to decrypt files or were unskilled in operational security.

Bitcoin Addresses Used

The three specific wallet addresses hardcoded into the malware, which are publicly visible on the blockchain, were:

- 13AM4VW2dhxYgXeQepoHkHSQuy6NgaEb94
- 12t9YDPgwueZ9NyMgw519p7AA8isjr6SMw
- 115p7UMMngo1pMvkhHijcRdfJNXj6LrLn

Exchange and Laundering Attempts

Analysis of the blockchain revealed that funds sent to these addresses were later moved in an attempt to launder the cryptocurrency. The attackers attempted to convert the Bitcoin into **Monero** via the exchange network **Shapeshift.io** to obscure the transaction trail due to Monero's higher level of anonymity. This laundering attempt was **thwarted** by Shapeshift, which blacklisted all known addresses associated with the WannaCry attackers to prevent the conversion of the tainted funds.

Attribution Implications

The use of only three fixed addresses, rather than unique addresses per victim, suggests a lack of sophistication among the threat actors. Because the payment addresses were shared among all victims, it was unclear how the attackers would know which specific computers to decrypt after payment. This ambiguity likely contributed to a very low success rate for the ransomware, with only a small fraction of the estimated 200,000 victims actually paying the demanded \$300 or \$600 ransoms.

What does the transaction pattern tell you about the operator?

Confidence: medium

The dual-output split architecture is deliberate and coordinated — all three wallets executed the same pattern within minutes of each other on Aug 3, 2017.

This level of coordination across three independent wallets in a narrow time window indicates automated tooling or a dedicated financial operations team, not manual execution.

The puppet loop is a deliberate investigator countermeasure — it consumes analyst time while real funds move through the two-output branch.

This is a known professional laundering technique.

Contradiction: Despite sophisticated laundering architecture, the hardcoded wallet addresses are a fundamental OPSEC failure — amateur mistake embedded inside a professional financial operation. This suggests the malware developer and the financial operations team were different people with different skill levels.
